Full-Stack On-Site Programming Assignment

Solicitation Browser

Overview

Every weekday, the U.S. Defense Logistics Agency posts hundreds of new Requests for Quotation (RFQs) to DIBBS, the Defense Internet Bid Board System, at `https://www.dibbs.bsm.dla.mil/`. Each one is a public solicitation a vendor can bid on, usually for a specific part identified by an NSN (National Stock Number).

That's a lot of opportunities, but most of them are irrelevant to any given vendor. Vendors need a fast way to find the RFQs worth quoting on.

Your task is to build a tool that pulls daily DIBBS solicitations and helps a vendor find the ones that matter to them.

This is an open-ended problem with no single "correct" solution. We want to see how you think, how you approach an unfamiliar challenge, and how you make tradeoffs under time constraints.

The Challenge

Build it your way. Choose your own tech stack, architecture, and approach. Create a full-stack web application where users can:

1. **Pull data from DIBBS** — at minimum the solicitation number and NSN for each RFQ. More fields are welcome.
2. **Browse** the solicitations.
3. **Find the opportunities they're interested in.** How you approach this is up to you.
4. **Open each row** back on its original page on DIBBS.

What We're Looking For

- **How users find opportunities** — what approach you chose, and why.
- **Problem-solving** — your thought process in arriving at the solution.
- **Judgment and taste** — the tradeoffs you made, what you prioritized, and what you chose to leave out.
- **Product sense** — whether it looks like something a vendor would actually want to use.

Stack

Your choice. Pick what gets you to a polished result quickly.

You can absolutely use AI tools (Cursor, Claude Code, Codex, whatever). We care about the product you ship and the calls you made, not whether you typed every line yourself.

Deliverable

Push your code to a Git repository and share the link with us. Be ready to give a short demo of your solution and walk us through your approach — we value out of the box thinking and creativity.

Time

You have 50 minutes for this assignment. This is about rapid prototyping, not production-ready code. A working MVP that shows your problem-solving approach is far more valuable than a polished but incomplete solution. Don't get stuck on perfection — show us how you think.
